About

Second-year B.Tech Computer Science student with interests in AI, backend engineering, full-stack development, and space technology. Proficient in Java and SQL, with hands-on experience building software applications, data-driven tools, and interactive visualizations. Interested in technical research, problem-solving, and developing practical software solutions.

Experience

Research Intern – Covering ISRO Aug 2026 – Present
THE GEOSTRATA | Remote – 3 Months

Conducting technical research on ISRO missions, emerging space technologies, and their real-world applications, with a focus on India's space programme. Researching and authoring technical content and documentation on space science, mission developments, and technological advancements, translating complex topics into clear, structured, and accessible material.

Hackathons & Achievements

Srijan Setu 2026 **Top 10 Finalist**
National-Level Hackathon | Chandigarh
Secured a place among the Top 10 finalists out of 200 participating teams, recognizing the team's solution and performance in a competitive national-level hackathon.

Smart India Hackathon (SIH) 2026 **Internal Hackathon Qualified**
Institutional-Level Selection
Cleared the college-level Internal Hackathon with NavSetu, a startup-friendly government procurement concept designed to streamline the journey from problem identification and pilot implementation to full-scale procurement.

Education

B.Tech – Computer Science & Engineering 2025 – Present
Uka Tarsadia University, Bardoli

12th / Senior Secondary (CBSE) 2024 – 2025
Shree Vasishtha Vidhyalaya, Surat

10th / Secondary (CBSE) 2022 – 2023
Shree Vasishtha Vidhyalaya, Surat

Skills

Languages: Java, Python (Intermediate), SQL, HTML, CSS, JavaScript

Databases: PostgreSQL, MySQL

Tools: Git, GitHub, VS Code, Figma, Canva

Full-Stack Development: MongoDB, Express.js, React.js, Node.js (MERN Stack)

Research & Communication: Technical Research, Documentation, Technical Writing, Report Writing, Summarization

Core Strengths: Problem-Solving, Adaptability, Curiosity, Consistency

Projects

APOGEE GitHub
D3.js, SGP4 Propagation
Developed a real-time 3D orbital tracking interface to visualize crewed space stations and orbital assets. Integrated SGP4 propagation algorithms to calculate satellite positions and forecast orbital trajectories, enabling interactive monitoring of space infrastructure.

Neo-Youtube-Downloader GitHub

Python, yt-dlp, Tkinter, FFmpeg

Built a desktop video downloader with a neo-brutalist interface, supporting multiple formats, dynamic resolution detection, playlists, and download history. Implemented metadata retrieval, live download progress, speed and ETA tracking, and FFmpeg-based media processing.

DocuMind – Local RAG Study Assistant GitHub

Python, Flask, FAISS, Hugging Face, Ollama, TinyLlama

Built an offline document question-answering tool that retrieves relevant information from uploaded PDF and TXT files using local language models. Applied document processing, semantic search, and information retrieval techniques to enable context-aware answers without relying on cloud-based LLM inference.
